# User Manuel For my recipe app

Upon entering the application you are greeted with a homepage like this. This home page contains "Add New Recipe", "Adjust"," Display", and "Exit" buttons. Each of these buttons will take you to a new page in which you can perform each of the following tasks. There is no actual menu included on this page since a majority of the page can be considered a menu.

The menu is included on the other pages at the top of the screen. Just like the main homepage the menu has the same options, Add, View and adjust. The View option includes a drop-down menu with the options to either Display the Recipes that were previously added or clear the recipes which have been stored.

If "Add new Recipe" is selected from the home page, you as the user are presented with a new Page called "Add Recipe". Here you will be prompted to Create a name for your recipe under "Recipe Name", asked to add ingredients to the recipe under "Ingredient Name", Add the quantities of the ingredients, select the units of measurements which have been stored in a combo box, add the calories and then which food group that ingredient belongs too. Once all of this has been filled in you can press the button "ADD RECIPE" to add the recipe. If you wish to add another recipe Just navigate to the top menu and press add. The application will reload the page and allow you to add a new recipe.

Due to there currently being no data store, the next option cannot be properly illustrated but the page itself is shown. If the option Display was selected from the home page, the program loads the users into a page that's looks the one attached below. An option is presented to the user to choose from a list of previously entered recipes which one they whish to display. The names of the recipes are displayed in order of entry and the user is prompted to enter the number in the textbox provide below. One the option has been selected the user should be able to see all the content added for the recipe they chose to display. If the user wishes to vie another recipe, they will have to navigate to the menu at the top, select "View", and then "Display" This way the page will again and allow them to reselect a recipe of choice to display.

If the exit button at the bottom of the page is select. It will close the application.

Due to some technical issues the adjust page is current unavailable. But the function of the Adjust page was to adjust data that has already been added. The user would have been prompted to again select which recipe they would like to adjust. Upon selecting the recipe, they would be given 3 options. Option one would have taken all the quantities saved in that recipe and halved them. Option two would have doubled all the recipes quantities and option 3 would have triples all the quantities. The User would the be asked if they would like to display and save the quantities or reset back to their original units.
